

This document provides information to help you determine how best to update your internal database with the NCOA<sup>Link®</sup> results. It also includes update details for Apartment Append and Proprietary Change of Address (PCOA). You should assess your own business needs and data practices to identify how to handle the output data based on your internal business rules and requirements.

There are several sections in this layout; however, for updating after NCOA<sup>Link</sup>, Apartment Append and PCOA processing, you only need to use data from the following sections:

- Input Data
- Standardized Data
- COA Data (Change of Address Data)
- Optional Flags

COA\_Rtncd field can be used for update decisions when there was no Apartment Append or PCOA match. COA\_Rtncd is output by NCOA<sup>Link®</sup> processing only.

**If you requested Apartment Append, use the opt flags field:**

If the opt\_flags field is populated with a 'U' then the address with the apartment information is found in the Std\_Address fields. If we found a PCOA match after appending the apartment number, then the opt\_flags field will have a 'U' and a 'P'.

The apartment address is in the standardized fields and the PCOA change of address is in the COA data fields.

**If the COA\_DelAdr is populated, use the COA Address fields**

Records coded with 'M', 'S', or '1' in the COA\_DlvCod are forwardable moves. In almost all cases, the new address provided should replace the input address. When we find a match to the NCOA or PCOA database, we return a move date in the COA\_Movdat field. If you have a field in your database that indicates the date the record was last updated with address information, you may want to consider whether or not to update to the new address we provide because what you have may be more current.

An 'L' in the COA\_DlvCod field indicates a USPS LACS<sup>Link®</sup> conversion. The contact has not moved; however, their rural address may be changed to a street-style address for 911 purposes, or their existing city-style address may have been renamed or renumbered. Continuing to mail to the original address may result in the mail not getting delivered.

A 'T' in the COA\_DlvCod field means the business suite number was added to the existing address.

**If the COA\_DelAdr is not populated, use the Std\_Address fields...Usually\*\***

NCOA<sup>Link®</sup> Nixies are addresses where

- the PO Box has closed (COA\_DlvCod=G)
- the contact has moved and left no forwarding address (COA\_DlvCod=K)
- the contact has moved to a foreign address (COA\_DlvCod=F)

An address coded as a Nixie doesn't mean the address itself is bad, just that the person or business you associated with that address is no longer there. You will have to decide if you want to take further action internally to get a better address for the contact, flag the record with a specific indicator, or do something else.

When deciding how to deal with Nixies, you will want to consider which is most important to you, the contact at the address or the address itself. If your data is made up of members or subscribers, then the contact is likely most important to you. In that case, you may want to code the Nixies as no longer at that address, and perhaps make an effort to locate a current address. Conversely, if you are a supplier of pool chemicals, the address with the pool is likely more important than the person who lives there. You might consider continuing to send to the address, but title slug, "New Neighbors".

A 'P' found in the COA\_DlvCod field means one of two things: either there is a Temporary Move for the occupant and NCOA<sup>Link</sup> does not provide new address information for Temporary Moves, or the USPS has a new address for the resident or business, but the new address cannot be confirmed as a valid delivery point at this time. The latter can occur with new construction and often records flagged with a 'P' will get a new address the next time the record is run through NCOA<sup>Link®</sup> processing.

**Delivery Point Validation**

A delivery point refers to the location at which mail is delivered. Delivery Point Validation™ (DPV®) is the process of *verifying* that an address actually exists and is one to which the Post Office delivers mail – right down to the apartment or suite number.

A DPV\_Flag of 'N' or blank indicates the address is not a valid delivery point. The address may be valid, and UPS may deliver packages there, but it is not one to which the USPS delivers mail. Some rural areas are required to have their mail delivered to PO Boxes, and having a street

address will result in a DPV\_Flag of 'N' or blank. An incomplete or invalid address may also result in a DPV\_Flag of 'N' or blank.

Additionally, Carrier Routes R777 and R779 are used to flag physical addresses that exist but are not eligible to receive mail and are known as Phantom Routes. These Carrier Routes are assigned during CASS processing and can be coded with **ANY** value in the DPV\_Flag field and will have R7 in the DPV\_Ftnts field. Mailing to addresses on these routes may result in undeliverable mail and wasted resources. Consider removing these addresses from your mailing list, contacting the intended recipients directly for a deliverable mailing address, or implementing alternative delivery strategies.

### **Vacant Addresses**

Addresses that have been vacant for 90 days or more are identified with a 'Y' in the DPV\_Vacant field. You will need to decide how you want to update these records in your system, indicating they are vacant and whether or not to mail to the addresses. It does take a while for the vacant indicator to be removed from the NCOA<sup>Link®</sup> master file once the address is occupied.

### **Move Date**

COA\_MovDat will contain a date in YYYYMM format corresponding to when the move became effective. If you have a field in your database that indicates the date an address was last updated, you may want to compare that date with the date in this field to determine whether or not to take the new address we returned.

### **Move Type**

The Move Type field provides the type of match that was made between your list and the USPS NCOA database. It does not indicate the type of move that was filed with the Postal Service.

- If COA\_MovTyp is 'F' (Family), the match was made on last name and address.
- If COA\_MovTyp is 'I' (Individual), the match was made on the full name and address.
- If COA\_MovTyp is 'B' (Business), the match was made on the business name and address.
- If COA\_MovTyp is 'P', the match was made with the Proprietary Change of Address database.

If you mail healthcare, financial, or other sensitive information, and you have a Family match, you may want to use an additional method to verify the new address.

### **Other Helpful Fields**

Additional fields you likely will find helpful are:

- DPV Footnotes (DPV\_Ftnts) - more in-depth information about the *quality of the input address*

- Status/Error Code Field (Std\_Status) – the most comprehensive information about *input address quality*

\*\* In some cases, you need to choose whether or not to update using the Std\_ address fields based on your rules and requirements. For example, we do not recommend you use the standardized address if the DPV\_Flag indicates the delivery point was not validated (delivery points that cannot be validated will have an 'N' or be blank in the DPV\_Flag field). Also, if the Std\_Status code indicates there were no substantial changes to the address, you might not want to update to preserve extraneous info or unusual punctuations that standardization would strip.
